1. 다음 글의 요지로 가장 적절한 것은? [2.3점]

Buying a television is current consumption. It makes us happy today but does nothing to make us richer tomorrow. Yes, money spent on a television keeps workers employed at the television factory. But if the same money were invested, it would create jobs somewhere else, say for scientists in a laboratory or workers on a construction site, while also making us richer in the long run. Think about college as an example. Sending students to college creates jobs for professors. Using the same money to buy fancy sports cars for high school graduates would create jobs for auto workers. The crucial difference between these scenarios is that a college education makes a young person more productive for the rest of his or her life; a sports car does not. Thus, college tuition is an investment; buying a sports car is consumption.

① 생산적 자산에 투자하려면 전문가의 조언이 필요하다.
② 현명한 소비는 장기적으로 투자와 동일하게 간주된다.
③ 학교에서 미래 자산 형성을 위한 경제 교육을 강화해야 한다.
④ 투자는 미래의 부와 생산성을 창출하는 면에서 소비와 다르다.
⑤ 국가의 성장을 위해서는 투자가 소비보다 먼저 이루어져야 한다.

2. 다음 글의 제목으로 가장 적절한 것은? [2.4점]

As the old joke goes: "Software, free. User manual, $10,000." But it's no joke. A couple of high-profile companies make their living selling instruction and paid support for free software. The copy of code, being mere bits, is free. The lines of free code become valuable to you only through support and guidance. A lot of medical and genetic information will go this route in the coming decades. Right now getting a full copy of all your DNA is very expensive ($10,000), but soon it won't be. The price is dropping so fast, it will be $100 soon, and then the next year insurance companies will offer to sequence you for free. When a copy of your sequence costs nothing, the interpretation of what it means, what you can do about it, and how to use it – the manual for your genes – will be expensive.

* sequence: (유전자) 배열 순서를 밝히다

① The Upcoming Era: Free Data, Expensive Guidance
② The Public Exposure of Medical and Genetic Information
③ Conservative Ways to Make One's Living: Selling Instruction for Free Software
④ Legal and Ethical Problems of Distributing Personal Genetic Information
⑤ How Insurance Companies Use the Manual for One's Genes for Their Interest

3. 다음 글의 주제로 가장 적절한 것은? [2.5점]

It's often said that those who can't do, teach. It would be more accurate to say that those who can do, can't teach the basics. A great deal of expert knowledge is implicit, not explicit. The further you progress toward mastery, the less conscious awareness you often have of the fundamentals. Experiments show that skilled golfers and wine aficionados have a hard time describing their putting and tasting techniques – even asking them to explain their approaches is enough to interfere with their performance, so they often stay on autopilot. When I first saw an elite diver do four and a half somersaults, I asked how he managed to spin so fast. His answer: "Just go up in a ball." Experts often have an intuitive understanding of a route, but they struggle to clearly express all the steps to take. Their brain dump is partially filled with garbage.

* aficionado: 애호가 ** somersault: 공중제비

① challenges experts encounter in teaching foundational skills of their fields
② importance of intuition in the transfer of advanced knowledge
③ benefits of implicit knowledge for demonstrating core principles
④ reasons why professionals can systematically explain the basics
⑤ necessity of conscious awareness when guiding novices

4. 다음 글을 읽고 답할 수 없는 질문은? [2.3점]

Mukseojipyeon is a collection of documents found inside *Bulguksa samcheung seoktap* (*Seokgatap*) in 1966. After a long conservation process, these documents finally revealed their identity. *Mukseojipyeon* includes important information about *Seokgatap*. People believed that the pagoda had never previously been restored or repaired. However, according to *Mukseojipyeon*, *Seokgatap* was restored during the Goryeo Dynasty. As the example of *Mukseojipyeon* shows, conservation science plays an important role in revealing historical truth. It not only restores cultural heritage to its original form but also reveals its hidden stories.

Baekje geumdonggwanmo are caps that were often given by the kings of Baekje to local leaders as rewards for their loyalty. The caps are famous for their delicate and beautiful patterns. Let's take a look at how the *Baekje geumdonggwanmo* was restored by conservation scientists. First, conservation scientists used X-ray photography to determine the original form. Then the cap was broken down into parts. During this process, conservation scientists removed foreign matter and rust from the surface and controlled corrosion with a chemical treatment. All the parts were then glued together and any damaged parts were repaired. At last, the cap regained its original form and shine.

① Where was *Mukseojipyeon* found?
② What information did *Mukseojipyeon* reveal?
③ Why did the kings of Baekje give *geumdonggwanmo* to local leaders?
④ How was the *Baekje geumdonggwanmo* restored by conservation scientists?
⑤ When did conservation scientists finish repairing the *Baekje geumdonggwanmo*?

5. 다음 글의 내용과 일치하는 것만을 <보기>에서 있는 대로 고른 것은? [3.1점]

In today's information age, in many companies and on many teams, the objective is no longer error prevention and replicability. On the contrary, it's creativity, speed, and keenness. In the industrial era, the goal was to minimize variation. But in creative companies today, maximizing variation is more essential. In these companies, the biggest risk isn't making a mistake or losing consistency; it's failing to catch top talent, to invent new products, or to change direction quickly when the environment shifts. Consistency and repeatability are more likely to suppress fresh thinking than to bring your company profit. A lot of little mistakes, while sometimes painful, help the organization learn quickly and are a critical part of the innovation cycle. In these situations, rules and process are no longer the best answer. A symphony isn't what you're going for. Leave the conductor and the sheet music behind. Build a jazz band instead.

< 보 기 >

(a) In the information age, many companies and teams aim at error prevention and replicability.
(b) The objective of companies in the industrial era was to minimize variations, while maximizing variations is considered more necessary in today's creative companies.
(c) In today's creative companies, the greatest risk is missing people with talent, hesitating to make new products, or being inconsistent.
(d) In the situations of mistakes being an important part of the innovation cycle, the best answer is to adhere to rules and process.

① (a) ② (b) ③ (b), (c)
④ (b), (d) ⑤ (c), (d)

6. 다음 글의 내용과 일치하는 것만을 <보기>에서 있는 대로 고른 것은? [3.5점]

Many things spark envy : ownership, status, health, youth, talent, popularity, beauty. It is often confused with jealousy because the physical reactions are identical. The difference: the subject of envy is a thing (status, money, health etc.). The subject of jealousy is the behaviour of a third person. Envy needs two people. Jealousy, on the other hand, requires three: Peter is jealous of Sam because the beautiful girl next door rings him instead. Paradoxically, with envy we direct resentments toward those who are most similar to us in age, career and residence. We don't envy businesspeople from the century before last. We don't envy millionaires on the other side of the globe. As a writer, I don't envy musicians, managers or dentists, but other writers. As a CEO you envy other, bigger CEOs. As a supermodel you envy more successful supermodels. Aristotle knew this: 'Potters envy potters.'

< 보 기 >

(a) The physical reactions produced by envy and jealousy are distinct, making them easy to tell apart.
(b) Envy is directed at a thing, such as money or health, and requires two people.
(c) Jealousy arises in relationships and involves three parties, as it revolves around the desire for what a third person possesses.
(d) Envy makes people feel resentment toward those whose personal circumstances, such as age, career, and residence, are most comparable to their own.

① (a), (b) ② (b), (c) ③ (b), (d)
④ (a), (c), (d) ⑤ (b), (c), (d)

7. 다음 글의 내용과 일치하는 것만을 <보기>에서 있는 대로 고른 것은? [3.6점]

People seem to recognize that the arts are cultural activities that draw on or react against certain cultural traditions, certain shared understanding, and certain values and ideas that mirror the time and place in which the art is created. In the case of science, however, opinions differ. Some scientists, like the great biologist J. B. S. Haldane, see science in a similar light — as a historical activity that occurs in a particular time and place, and that requires understanding within that context. Others, however, see science as a purely "objective" pursuit, uninfluenced by the cultural viewpoint and values of those who create it. In describing this view of science, philosopher Hugh Lacey speaks of the belief that there is an underlying order of the world which is simply there to be discovered —the world of pure "fact" stripped of any link with value. The aim of science according to this view is to represent this world of pure "fact", independently of any relationship it might bear contingently to human practices and experiences.

* contingently: 혹여라도

< 보 기 >

(a) It appears that people understand the arts as cultural activities that build upon or challenge certain cultural traditions, certain shared understanding, and certain values and ideas that reflect the time and place where they are made.

(b) In the view of some scientists, including J. B. S. Haldane, science is a historical activity that happens in a certain time and place and requires understanding in its context.

(c) There are other scientists who consider science an objective pursuit, free from the influence of the cultural perspectives and values of its creators.

(d) According to the view of science with no connection to values, science aims to represent the realm of pure fact, inseparable from its relation to human activities and experiences.

① (a), (d) ② (b), (c) ③ (a), (b), (c)
④ (a), (b), (d) ⑤ (a), (c), (d)

8. <A>는 다음 글을 읽고 선생님과 학생들이 나눈 대화이다. 다음 글의 내용을 바르게 이해한 학생으로 알맞게 짝지어진 것은? [4.2점]

Weber's law concerns the perception of difference between two stimuli. This principle applies to sensory inputs such as length, light, and sound. For instance, it suggests that we might not be able to detect a 1-mm difference when we are looking at lines 466 mm and 467 mm in length, but we may be able to detect a 1-mm difference when we are comparing a line 2 mm long with one 3 mm long. Therefore, the Just-noticeable difference (JND) varies as a function of the strength of the signals. For example, the JND is greater for very loud noises than it is for much more quiet sounds. When a sound is very weak, we can tell that another sound is louder, even if it is barely louder. When a sound is very loud, to tell that another sound is even louder, it has to be much louder.

< A >

Teacher: Based on what we read, let's talk about what you understood. Share your thoughts freely about the content.

Amy: Weber's law is about how we perceive the difference between two stimuli. The example of comparing lines illustrates that our perception of difference is absolute rather than relative.

Ben: I'd like to talk about how Weber's law applies to light. For example, if you light one candle in a completely dark room, it's easy to notice the difference. However, if you light one more candle in a room with 100 candles already lit, the difference may not be noticeable.

Leo: As illustrated by the noise example, the Just-noticeable difference (JND) is inversely proportional to the intensity of the stimulus, with quiet sounds requiring a large increase to be noticeable, while loud sounds require only a small increase.

Sam: According to Weber's law, distinguishing between two samples becomes harder when these samples are larger or stronger levels of the stimuli.

① Amy, Leo ② Amy, Sam ③ Ben, Leo
④ Ben, Sam ⑤ Leo, Sam

9. 밑줄 친 one planet within the vast universe of material flows that connect all life가 다음 글에서 의미하는 바로 가장 적절한 것은? [3.7점]

One well-known shift took place when the accepted view — that the Earth was the center of the universe — changed to one where we understood that we are only inhabitants on one planet orbiting the Sun. With each person who grasped the solar system view, it became easier for the next person to do so. So it is with the notion that the world revolves around the human economy. Now, we are beginning to see the economy as one planet within the vast universe of material flows that connect all life. When this perspective shifts into place, it will be obvious that our economic well-being requires that we account for, and respond to, factors of ecological health. Unfortunately we do not have a century or two to make the change. By clarifying the nature of the old and new perspectives, and by identifying actions on which we might cooperate to move the process along, we can help accelerate the shift.

① an isolated system that focuses solely on economic well-being
② an autonomous structure that maintains itself through economic activities alone
③ a component of a larger system of ecological processes that support all living things
④ a primary system around which all other ecological and environmental processes revolve
⑤ a small element of a larger framework that functions separately from natural ecosystems

10. 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것은? [3.0점]

> Sleep is clearly about more than just resting. One curious fact is that animals that are hibernating also require periods of sleep.

(A) Surprisingly to most of us, bears - the most famous wintry sleepers - don't actually hibernate. To understand why bears aren't considered true hibernators, it's important to look at what real hibernation actually entails.
(B) This need arises from the neurological and metabolic differences between hibernation and sleep. Hibernating is more like being anesthetized: the subject is unconscious but not actually asleep. Thus, a hibernating animal needs to get a few hours of conventional sleep each day within the larger unconsciousness.
(C) It involves profound unconsciousness and a dramatic fall in body temperature. Given these characteristics, bears don't hibernate because their body temperature stays near normal and they are easily awakened. Their winter sleeps are more accurately called a state of torpor.

① (A) - (C) - (B)　② (B) - (A) - (C)
③ (B) - (C) - (A)　④ (C) - (A) - (B)
⑤ (C) - (B) - (A)

11. 다음 글의 밑줄 친 문장 중, 어법상 틀린 것은? [3.3점]

① The Net differs from most of the mass media that it replaces in an obvious and very important way: it's bidirectional. ② We can both send and receive messages through the network, which has made the system even more valuable. ③ The ability to exchange information online, to upload as well as download, has turned the Net into a thoroughfare for business and commerce. ④ In just a few clicks, people can browse online catalogues, place orders, monitor shipments, and update details in company databases. ⑤ However, not only do the Net connect us with businesses but it also connects us with one another. It's a personal broadcasting medium as well as a commercial one. Millions of people use it to distribute their own digital creations, in the form of blogs, videos, photos, songs, and podcasts, as well as to critique, edit, or otherwise modify the creations of others.

* bidirectional: 두 방향으로 작용하는 ** thoroughfare: 통로

12. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? [3.4점]

We have biases that support our biases! If we're partial to one option —perhaps because it's more memorable, or framed to minimize loss, or seemingly consistent with a promising pattern —we tend to search for information that will justify choosing that option. On the one hand, it's sensible to make choices that we can defend with data and a list of reasons. On the other hand, if we're not careful, we're likely to conduct an imbalanced analysis, falling prey to a cluster of errors ① that we collectively refer to as "confirmation biases." For example, nearly all companies include classic "tell me about yourself" job interviews as part of the hiring process, and many rely on these interviews alone ② to evaluate applicants. But it turns out that traditional interviews are actually one of the least useful tools for predicting an employee's future success. This is because interviewers often subconsciously make up their minds about interviewees based on their first few moments of interaction and ③ spend the rest of the interview cherry-picking evidence and phrasing their questions to confirm that initial impression: "I see here you left a good position at your previous job. You must be pretty ambitious, right?" versus "You must not have been very committed, huh?" This means that interviewers can be prone to overlooking significant information that would clearly indicate ④ whether this candidate was actually the best person to hire. More structured approaches, like obtaining samples of a candidate's work or asking how he would respond to difficult hypothetical situations, ⑤ offering nearly three times the effectiveness of traditional interviews in assessing future success.

13. 다음 글의 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은? [3.8점]

If we've invested in something that hasn't repaid us — be it money in a failing venture, or time in an unhappy relationship — we find it very difficult to walk away. This is the sunk cost fallacy. Our instinct is to continue investing money or time as we hope that our investment will prove to be worthwhile in the end. Giving up would mean acknowledging that we've wasted something we can't get back, and that thought is so painful that we prefer to avoid it if we can. The problem, of course, is that if something really is a bad bet, then _____(A)_____. Rather than walk away from a bad five-year relationship, for example, we turn it into a bad 10-year relationship; rather than accept that we've lost a thousand dollars, we lay down another thousand and lose that too. In the end, _____(B)_____. Sometimes we just have to cut our losses.

	(A)	(B)
①	staying with it deepens our losses	… facing the real problem reduces profit
②	our losses dwindle, staying in it	… accepting the discomfort of wasted money and time will pay off our efforts
③	staying with it adds to the amount we lose	… by putting off the discomfort of facing our losses, we end up making things worse
④	not walking away from it mitigates our losses	… postponing the pain of acknowledging the truth worsens it
⑤	our losses increase, getting out of the bad bet	… by confronting the pain of admitting our problem, we only add to it

14. 다음 글의 빈칸에 들어갈 말로 가장 적절한 것은? [3.2점]

Where scientific research is concerned, explanatory tales are expected to adhere closely to experimental data and to illuminate the regular and predictable features of experience. However, this paradigm sometimes fails to reveal that theories are heavily influenced by _____. Scientific explanations do not just relate a chronology of facts. They construct frameworks for systematically chosen data in order to provide a consistent and meaningful explanation of what is observed. Such constructions lead us to imagine specific kinds of subject matter in particular sorts of relations, and the storylines they inspire will prove more effective for analyzing some features of experience over others. When we neglect the creative contributions of such scientific imagination and treat models and interpretive explanations as straightforward facts — even worse, as facts including all of reality — we can blind ourselves to the limitations of a given model and fail to note its potential for misunderstanding a situation to which it ill applies.

* illuminate: 밝히다

① a chronological order of facts that accurately reflects all aspects of reality
② immutable laws that eliminate the need for creative input in scientific models
③ standardized techniques that guarantee all scientific findings are universally applicable
④ creative aspects that guide how research projects are designed and how data is understood
⑤ procedural elements that dictate the construction of research studies and the interpretations of evidence

15. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? [4.0점]

We encounter contrary claims about the relation of literature to action. Theorists have maintained that literature encourages solitary reading and reflection as the way to engage with the world and thus ① advocates the social and political activities that might produce social change. At best it encourages detachment or appreciation of complexity, and at worst passivity and acceptance of what is. But on the other hand, literature has historically been seen as dangerous, as it ② stimulates people to question authority and social arrangements. Plato banned poets from his ideal republic because they could only do ③ harm, and novels have long been credited with making people dissatisfied with their lives and eager for something new. By promoting identification across divisions of class, gender, and race, books may promote a fellowship that discourages struggle; but they may also produce a keen sense of injustice, serving as the ④ impetus for progressive struggles. Historically, works of literature are credited with producing change: Uncle Tom's Cabin, a best-seller in its day, contributed to ⑤ generating a revulsion against slavery that made possible the American Civil War.

16. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? [2.7점]

Most people resist the idea of a true self-estimate, probably because they fear it might mean ① lowering some of their beliefs about who they are and what they're capable of. As Goethe's maxim goes, it is a great failing "to see yourself as more than you are." How could you really be considered self-aware if you refuse to consider your ② limitations? Don't fear self-assessment because you're worried you might have to admit some things about yourself. The second half of Goethe's maxim is important too. He states that it is equally damaging to "value yourself at less than your true worth." We ③ underestimate our capabilities just as much and just as dangerously as we overestimate other abilities. Cultivate the ability to judge yourself ④ vaguely. Look inward to discern what you're capable of and what it will take to ⑤ unearth that potential.

* maxim: 격언

17. 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은? [2.9점]

> However, this rule does not apply to nomadic desert species, which can exceptionally initiate their breeding cycle within days of rain.

Near the equator, many species of bird breed all year round. But in temperate and polar regions, the breeding seasons of birds are often sharply defined. They are triggered mainly by changes in day length. If all goes well, the outcome is that birds raise their young when the food supply is at its peak. Most birds are not simply reluctant to breed at other times but they are also physically incapable of doing so. (①) This is because their reproductive system shrinks, which helps flying birds save weight. (②) They do this to take full advantage of such a sudden breeding opportunity. (③) Also, different species divide the breeding season up in different ways. (④) Most seabirds raise a single brood, but in warm regions songbirds may raise several families in a few months. (⑤) In an exceptionally good year, a pair of House Sparrows, a kind of songbird, can raise successive broods through a marathon reproductive effort.

* brood: 함께 태어난 새끼들

18. 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은? [2.8점]

> That's because mental development varies in pace among individuals and is strongly affected by the social and family surroundings.

Mental development consists of individuals increasingly mastering social codes and signals themselves, which they can master only in social situations with the support of more competent individuals, typically adults. In this sense, mental development consists of internalizing social patterns and gradually becoming a responsible actor among other responsible actors. (①) In Denmark, the age of criminal responsibility is 15 years. (②) This means that we then say that people have developed sufficient mental maturity to be accountable for their actions at this point. (③) And at the age of 18 people are given the right to vote and are thereby formally included in the basic democratic process. (④) I do not know whether these age boundaries are optimal. (⑤) Therefore, having formal limits for responsibility from a specific age that apply to everyone is a somewhat questionable practice. But the question, of course, is whether it can be done any differently.

19. 다음 글에서 전체 흐름과 관계 없는 문장은? [2.6점]

If there is little or no diversity of views, and all scientists see, think, and question the world in a similar way, then they will not, as a community, be as objective as they maintain they are, or at least aspire to be. ① The solution is that there should be far greater diversity in the practice of science. ② Specifically, this includes diversity in gender, ethnicity, and social and cultural backgrounds in practicing science. ③ Science works because it is carried out by people who pursue their curiosity about the natural world and test their and each other's ideas from as many varied perspectives and angles as possible. ④ Curiosity is a key factor in designing experiments, but it can sometimes lead scientists to prioritize personal interests over objectivity. ⑤ When science is done by a diverse group of people, and if consensus builds up about a particular area of scientific knowledge, then we can have more confidence in its objectivity and truth.

* consensus: 일치

20. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A)~(C)에 들어갈 말로 가장 적절한 것은? [4.1점]

Some people argue that there is a single, logically consistent concept known as reading that can be neatly set apart from everything else people do with books. Is reading really that simple? The most productive way to think about reading is as a loosely related set of behaviors that belong together owing to family resemblances, as Ludwig Wittgenstein used the phrase, without having in common a single defining trait. Consequently, efforts to distinguish reading from nonreading are destined to fail because there is no agreement on what qualifies as reading in the first place. The more one tries to figure out where the border lies between reading and not-reading, the more edge cases will be found to stretch the term's flexible boundaries. Thus, it is worth attempting to collect together these exceptional forms of reading into a single forum, one highlighting the challenges faced by anyone wishing to establish the boundaries where reading begins and ends. The attempt moves toward an understanding of reading as a spectrum that is expansive enough to include the distinct reading activities.

⬇

> In the ___(A)___ of a single defining characteristic, reading is better understood as a spectrum of related behaviors with ___(B)___ boundaries, ___(C)___ diverse and exceptional forms of reading.

	(A)	(B)	(C)
①	absence	fluid	incorporating
②	existence	blurred	oppressing
③	deficiency	rigid	accomodating
④	lack	ambiguous	excluding
⑤	presence	strict	encompassing

21. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A)~(C)에 들어갈 말로 가장 적절한 것은? [3.9점]

On our little world, light travels, for all practical purposes, instantaneously. If a lightbulb is glowing, then of course it's physically where we see it, shining away. We reach out our hand and touch it: It's there all right, and unpleasantly hot. If the filament fails, then the light goes out. We don't see it in the same place, glowing, illuminating the room years after the bulb breaks and it's removed from its socket. The very notion seems nonsensical. But if we're far enough away, an entire sun can go out and we'll continue to see it shining brightly; we won't learn of its death, perhaps, for ages to come — in fact, for the span of time required for light, which travels fast but not infinitely fast, to cross the intervening vastness. The immense distances to the stars and the galaxies mean that we see everything in space in the past.

* intervene: 사이에 들다

⬇

In contrast to the ___(A)___ perception of light that we experience in our everyday world, the ___(B)___ speed of light across the vast distances of space means we see distant stars and galaxies in a past state, with their light ___(C)___ after they have perished.

	(A)		(B)		(C)
①	delayed	…	finite	…	enduring
②	immediate	…	finite	…	persisting
③	progressive	…	infinite	…	fading
④	spontaneous	…	infinite	…	extinguishing
⑤	instantaneous	…	finite	…	vanishing

22. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은? [2.7점]

Any new or threatening situation may require us to make decisions and this requires information. So important is communication during a disaster that normal social barriers are often lowered. We will talk to strangers in a way we would never consider normally. Even relatively low grade disruption of our life such as a fire drill or a very late train seems to give us the permission to break normal etiquette and talk to strangers. The more important an event to a particular public, the more detailed and urgent the requirement for news becomes. Without an authoritative source of facts, whether that is a newspaper or trusted broadcast station, rumours often run riot. Rumours start because people believe their group to be in danger and so, although the rumour is unproven, feel they should pass it on. For example, if a worker heard that their employer's business was doing badly and people were going to be made redundant, they would pass that information on to colleagues.

* redundant: (일시) 해고된

⬇

In a dangerous situation, people ___(A)___ information, though it is ___(B)___.

	(A)		(B)
①	are inclined to deliver	…	unreliable
②	are prone to providing	…	authoritative
③	are likely to share	…	impartial
④	tend to ignore	…	unproven
⑤	appear to manipulate	…	credible

[논술형 1] <B>는 <A>의 요약이다. <B>의 빈칸 (a)~(d)에 들어갈 말을 <조건>에 맞게 완성하시오. [총 4.5점]

<A>

The built-in capacity for smiling is proven by the remarkable observation that babies who are congenitally both deaf and blind, who have never seen a human face, also start to smile at around 2 months. However, smiling in blind babies eventually disappears if nothing is done to reinforce it. Without the right feedback, smiling dies out. But here's a fascinating fact: blind babies will continue to smile if they are cuddled, bounced, nudged, and tickled by an adult — anything to let them know that they are not alone and that someone cares about them. This social feedback encourages the baby to continue smiling. In this way, early experience operates with our biology to establish social behaviors. In fact, you don't need the cases of blind babies to explain the point. Babies with sight smile more at you when you look at them or, better still, smile back at them.

* congenitally: 선천적으로 ** nudge: 팔꿈치로 쿡쿡 찌르다

<B>

___(a)___ is an innate capacity seen even in deaf and blind babies, who do it naturally around two months old. However, if there is no right feedback, it ___(b)___. Physical affection like cuddling and tickling helps ___(c)___, showing how ___(d)___ this behavior. For sighted babies, smiles are also reinforced by social connection when someone engages with them.

< 조 건 >

(c), (d): <보기>의 단어만을 모두 한 번씩만 사용할 것. (단어 추가 금지) 필요 시, <보기>의 단어의 형태를 변형할 것.

< 보 기 >

interaction / continue / reinforce / blind babies / smile / social / to

(a): Smiling (1단어) [0.5점]

(b): disappears (1단어) [1.0점]

(c): blind babies continue to smiling [1.5점]

(d): social interaction reinforces [1.5점]

[논술형 2] <B>는 <A>의 연구를 실행하면서 작성한 노트이다. <A>의 내용과 일치하도록 <B>의 빈칸 (a)~(d)에 들어갈 말을 <조건>에 맞게 완성하시오. [총 4.5점]

<A>

We collect stamps, coins, vintage cars even when they serve no practical purpose. The post office doesn't accept the old stamps, the banks don't take old coins, and the vintage cars are no longer allowed on the road. These are all side issues; the attraction is that they are unavailable. In one study, students were asked to arrange ten posters in order of attractiveness — with the agreement that afterward they could keep one poster as a reward for their participation. Five minutes later, they were told that the poster with the third highest rating was no longer available. Then they were asked to evaluate all ten from scratch. The poster that was no longer available was suddenly classified as the most beautiful. In psychology, this phenomenon is called reactance: unavailability of an option enhances its perceived value.

<B>

Hypothesis: _____(a)_____.

Procedures:

① Participants were presented with ten posters and were instructed to arrange them in order of attractiveness. They were also informed that they would be allowed to keep one of the posters as a(n) ____(b)____ for their participation.

② Five minutes later, they were told that the poster they rated as the third most attractive was not available and were instructed to ____(c)____ the ten posters again.

③ The participants classified the third highest poster as the most beautiful one.

Results:

There was a significant increase in the attractiveness of the poster that became ____(d)____.

Conclusion: The hypothesis is proven correct.

We tend to break up time into units, such as weeks, months, and seasons; in a series of studies among farmers in India and students in North America, psychologists found that if a deadline is on the other side of a "break" — such as in the New Year — we're more likely to see it as remote, and, as a result, be less ready to jump into action. What you need to do in that situation is find another way to think about the timeframe. Let's consider that deadlines are tasks you have to complete within a period that's imminent. That way the stress is more manageable, and you have a better chance of starting — and therefore finishing — in good time.

* imminent: 임박한

<B>

Ann: Did you read that passage about how we categorize time? It explains our tendency to divide time into units.

Max: Yes, I found it interesting! The passage mentioned that if a deadline falls on the ____(a)____ of a time break, we're more likely to see it as far away and delay taking action.

Ann: That's right. The author suggests that we rethink the time frame. Deadlines should ____(b)____ within a short period of time.

Max: Let me see... It's November now, and our project is due in January. To create a sense of urgency, it's better to tell ourselves that the deadline ____(c)____.

Ann: You got it! Let's keep thinking of it as a winter project to stay focused and start early.

Max: Yes, it's like we trick our minds ____(d)____.

Gyeongcheonsa sipcheung seoktap is well-known for its elaborate decorations, splendid shape, and unique structure. The pagoda was originally built in 1348 during the Goryeo Dynasty, but it was disassembled and illegally transported to Japan by a Japanese court official. Korea was able to retrieve it only in 1918, but it remained in a disassembled state for forty years at Gyeongbokgung Palace because conservation skills at that time were not good enough to restore it. Although the pagoda was first restored in 1960, it suffered from wind, rain, and so on as time went by. So the pagoda was repaired again and moved inside the National Museum of Korea in 2005. The pagoda was re-restored through a ten-year conservation work (1995-2005) carried out by conservation scientists, during which the cement from the first restoration process was removed. They replaced it with marble, which is the same material as the original stone. They also restored some of the original decorations. They carried out another important process, which was rebuilding the first three stories of the body. During the conservation process, scientists found that the first three stories had been put together incorrectly, so they put them back in the right order.

<B>

Dear Amy,

I wanted to share with you something impressive about Korea's conservation efforts, especially regarding one of our national treasures, *Gyeongcheonsa sipcheung seoktap*. Originally ____(a)____ in 1348 during the Goryeo Dynasty, the pagoda endured many adversities. It was taken apart and illegally transported to Japan by a Japanese court official. Only in 1918 _____(b)_____. However, conservation techniques were not advanced enough at the time to handle such a complex structure, so it was left ____(c)____ for forty years at Gyeongbokgung Palace.

The first attempt to restore the pagoda took place in 1960. Unfortunately, it continued to break down over time due to exposure to wind, rain, and other environmental factors. As a result, it was repaired once more and relocated to the National Museum of Korea in 2005. It _____(d)_____, from 1995 to 2005. During this work, the scientists _____(e)_____ in the initial restoration process. They replaced it with marble, which matched the original stone, and also restored some of the pagoda's original decorations. Additionally, they corrected the arrangement of the ___(f)___ of the body, which had been improperly assembled in the past.

Now you know the journey this pagoda took to be preserved. I hope you enjoyed learning a bit about Korea's heritage efforts. More stories to come!

The well-known American ethnologist Alfred Louis Kroeber made a rich and in-depth study of women's evening dress in the West, stretching back about three centuries and using reproductions of engravings. Having adjusted the dimensions of these plates due to their diverse origins, he was able to analyse the constant elements in fashion features and to come up with a study that was neither intuitive nor approximate, but precise, mathematical and statistical. He reduced women's clothing to a certain number of features: length and size of the skirt, size and depth of the neckline, height of the waistline. He demonstrated unambiguously that fashion is a profoundly regular phenomenon which is not located at the level of annual variations but on the scale of history. For practically 300 years, women's dress was subject to a very precise regular cycle: forms reach the furthest point in their variations every fifty years. If, at any one moment, skirts are at their longest, fifty years later they will be at their shortest; thus skirts become long again fifty years after being short and a hundred years after being long.

* dimension: 크기

Title: How Kroeber _____(a)_____ in Women's Dress Fashions over Three Centuries

A Scientific Approach to Fashion

This article explores groundbreaking findings by Alfred Louis Kroeber, the eminent American ethnologist. Kroeber thoroughly examined 300 years of Western women's evening dress by utilizing _____(b)_____ and standardizing their dimensions for consistency. This adjustment enabled him _____(c)_____ in fashion features. Rather than relying on intuition or approximation, Kroeber's study employed a precise, mathematical, and statistical approach.

Patterns Through History

His research revealed that fashion follows a remarkably regular pattern, not determined by _____(d)_____. Instead, it unfolds on the scale of history. For nearly three centuries, women's dress underwent cyclical changes, with forms reaching their most extreme variations every fifty years.

The Impact of Kroeber's Analysis

Without Kroeber's analysis, _____(e)_____.
